

Day 12 — Automated Lead Management System

1. Project Overview

The Automated Lead Management System is an n8n workflow designed to receive, validate, process, score, and route incoming leads automatically.

The workflow accepts lead information through a Webhook and assigns each lead a priority based on its budget and requested service.

Routing:

- High Priority → Immediate sales notification
- Medium Priority → Saved to a Google Sheet
- Low Priority → Added to a lead nurture/follow-up Google Sheet
- All valid leads → Automatic acknowledgment email

2. Objective

The objective of this project is to build a complete automated lead-management pipeline using n8n.

The workflow demonstrates:

- Webhook integration
- Data validation
- Data processing
- JavaScript Code nodes
- Lead scoring
- Conditional routing
- Google Sheets integration
- Gmail integration
- Automated email notifications

3. Workflow Architecture

Webhook → Validation → Lead Processing → Lead Scoring → Set Priority → Switch → Route → Acknowledgment Email

High Priority → Sales notification through Gmail

Medium Priority → Medium Priority Google Sheet

Low Priority → Lead Nurture / Follow-Up Google Sheet

Final → Automatic acknowledgment email to the lead

4. Input Data

The Webhook accepts:

- Name
- Email
- Company
- Service
- Budget

Sample input:

```
{  
  "name": "Tayyiba Jagwal",  
  "email": "tayyiba@example.com",  
  "company": "ABC Solutions",  
  "service": "AI Development",  
  "budget": 150000  
}
```

5. Workflow Steps

Step 1 — Webhook

The Webhook receives lead information using an HTTP POST request in JSON format.

Step 2 — Validation

The workflow checks whether Name, Email, Company, Service, and Budget are present. A valid lead produces `isValid: true` and `missingFields: []`.

Step 3 — Lead Processing

The workflow removes unnecessary spaces, converts email to lowercase, converts budget into a number, and standardizes the field names.

Step 4 — Lead Scoring

The workflow calculates a score using the lead's budget and requested service.

Step 5 — Set Priority

The total score is converted into High, Medium, or Low priority.

Step 6 — Switch

The Switch node routes the lead to the correct branch based on its priority.

6. Lead Scoring

Budget Scoring:

- 100,000 or more → 50 points
- 50,000–99,999 → 30 points
- Less than 50,000 → 10 points

Service Scoring:

- Web Development → 30 points
- Mobile Development → 30 points
- AI Development → 30 points
- Automation → 30 points
- Other services → 10 points

Total Score = Budget Score + Service Score

7. Priority Classification

- 60–80 → High
- 40–59 → Medium
- 0–39 → Low

8. Lead Routing

High Priority:

High-priority leads are sent to the sales team through Gmail for immediate attention. The notification contains the lead name, email, company, service, budget, score, and priority.

Medium Priority:

Medium-priority leads are stored in the Medium Priority Leads Google Sheet.

Columns:

Name, Email, Company, Service, Budget, Score, Priority

Low Priority:

Low-priority leads are stored in the Lead Nurture List Google Sheet.

Columns:

Name, Email, Company, Service, Budget, Score, Priority, FollowUp

The FollowUp field is set to Yes.

9. Automatic Acknowledgment Email

After the lead is routed, an automatic acknowledgment email is sent to the lead's email address. The recipient is taken dynamically from the lead's Email field.

The email confirms that the inquiry has been received and that the team will review the requirements.

10. Sample Test Cases

HIGH PRIORITY

Name: Tayyiba Jagwal

Email: tayyiba@example.com

Company: ABC Solutions
Service: AI Development
Budget: 150000
Expected Score: 80
Expected Priority: High
Expected Route: Sales Notification

MEDIUM PRIORITY
Name: Sara Ahmed
Email: sara@example.com
Company: XYZ Ltd
Service: Web Development
Budget: 50000
Expected Score: 60
Expected Priority: Medium
Expected Route: Medium Priority Google Sheet

LOW PRIORITY
Name: Usman Ali
Email: usman@example.com
Company: Small Business
Service: SEO
Budget: 20000
Expected Score: 20
Expected Priority: Low
Expected Route: Lead Nurture Google Sheet

11. Tools Used

- n8n — Workflow automation
- Postman — Webhook/API testing
- Google Sheets — Lead storage
- Gmail — Sales notification and acknowledgment email
- JavaScript — Lead processing and scoring

12. Testing

The workflow was tested using sample POST requests through Postman.

Three priority scenarios were used:

1. High Priority
2. Medium Priority
3. Low Priority

The results were verified through the corresponding Gmail notification and Google Sheets routes.

13. Deliverables

- Workflow JSON
- README documentation
- Sample API request
- Workflow screenshots
- 2–5 minute demonstration video

14. Conclusion

The Automated Lead Management System provides an automated way to process incoming leads without manually reviewing every submission.

The workflow validates the lead, processes the information, calculates a score, assigns a priority, routes the lead to the appropriate destination, and sends an acknowledgment email.

This project demonstrates the practical use of webhooks, APIs, JavaScript, conditional logic, routing, Google Sheets, Gmail, and n8n automation.
