

Student Record Classification Workflow

Objective

The purpose of this workflow is to automatically classify student records according to their scores. The workflow uses JSON data and expressions in n8n to generate the final output.

Workflow Structure

The workflow contains the following nodes:

- Manual Trigger
- Edit Fields (Set)
- Edit Fields (Set)

Student Information

Each student record contains the following fields:

- Name
- Email
- Department
- Score

Classification Rules

The following rules are used to classify students:

- Score greater than or equal to 80: Excellent
- Score between 60 and 79: Good
- Score below 60: Needs Improvement

Node Explanation

Manual Trigger

This node starts the workflow manually whenever the user executes it.

Edit Fields (Set)

This node creates the student data fields, including the student's name, email address, department, and score.

Edit Fields (Set)

This node uses an expression to evaluate the student's score and automatically assign the appropriate classification.

Output

The workflow generates a clean JSON object containing all the student information and the classification result.
